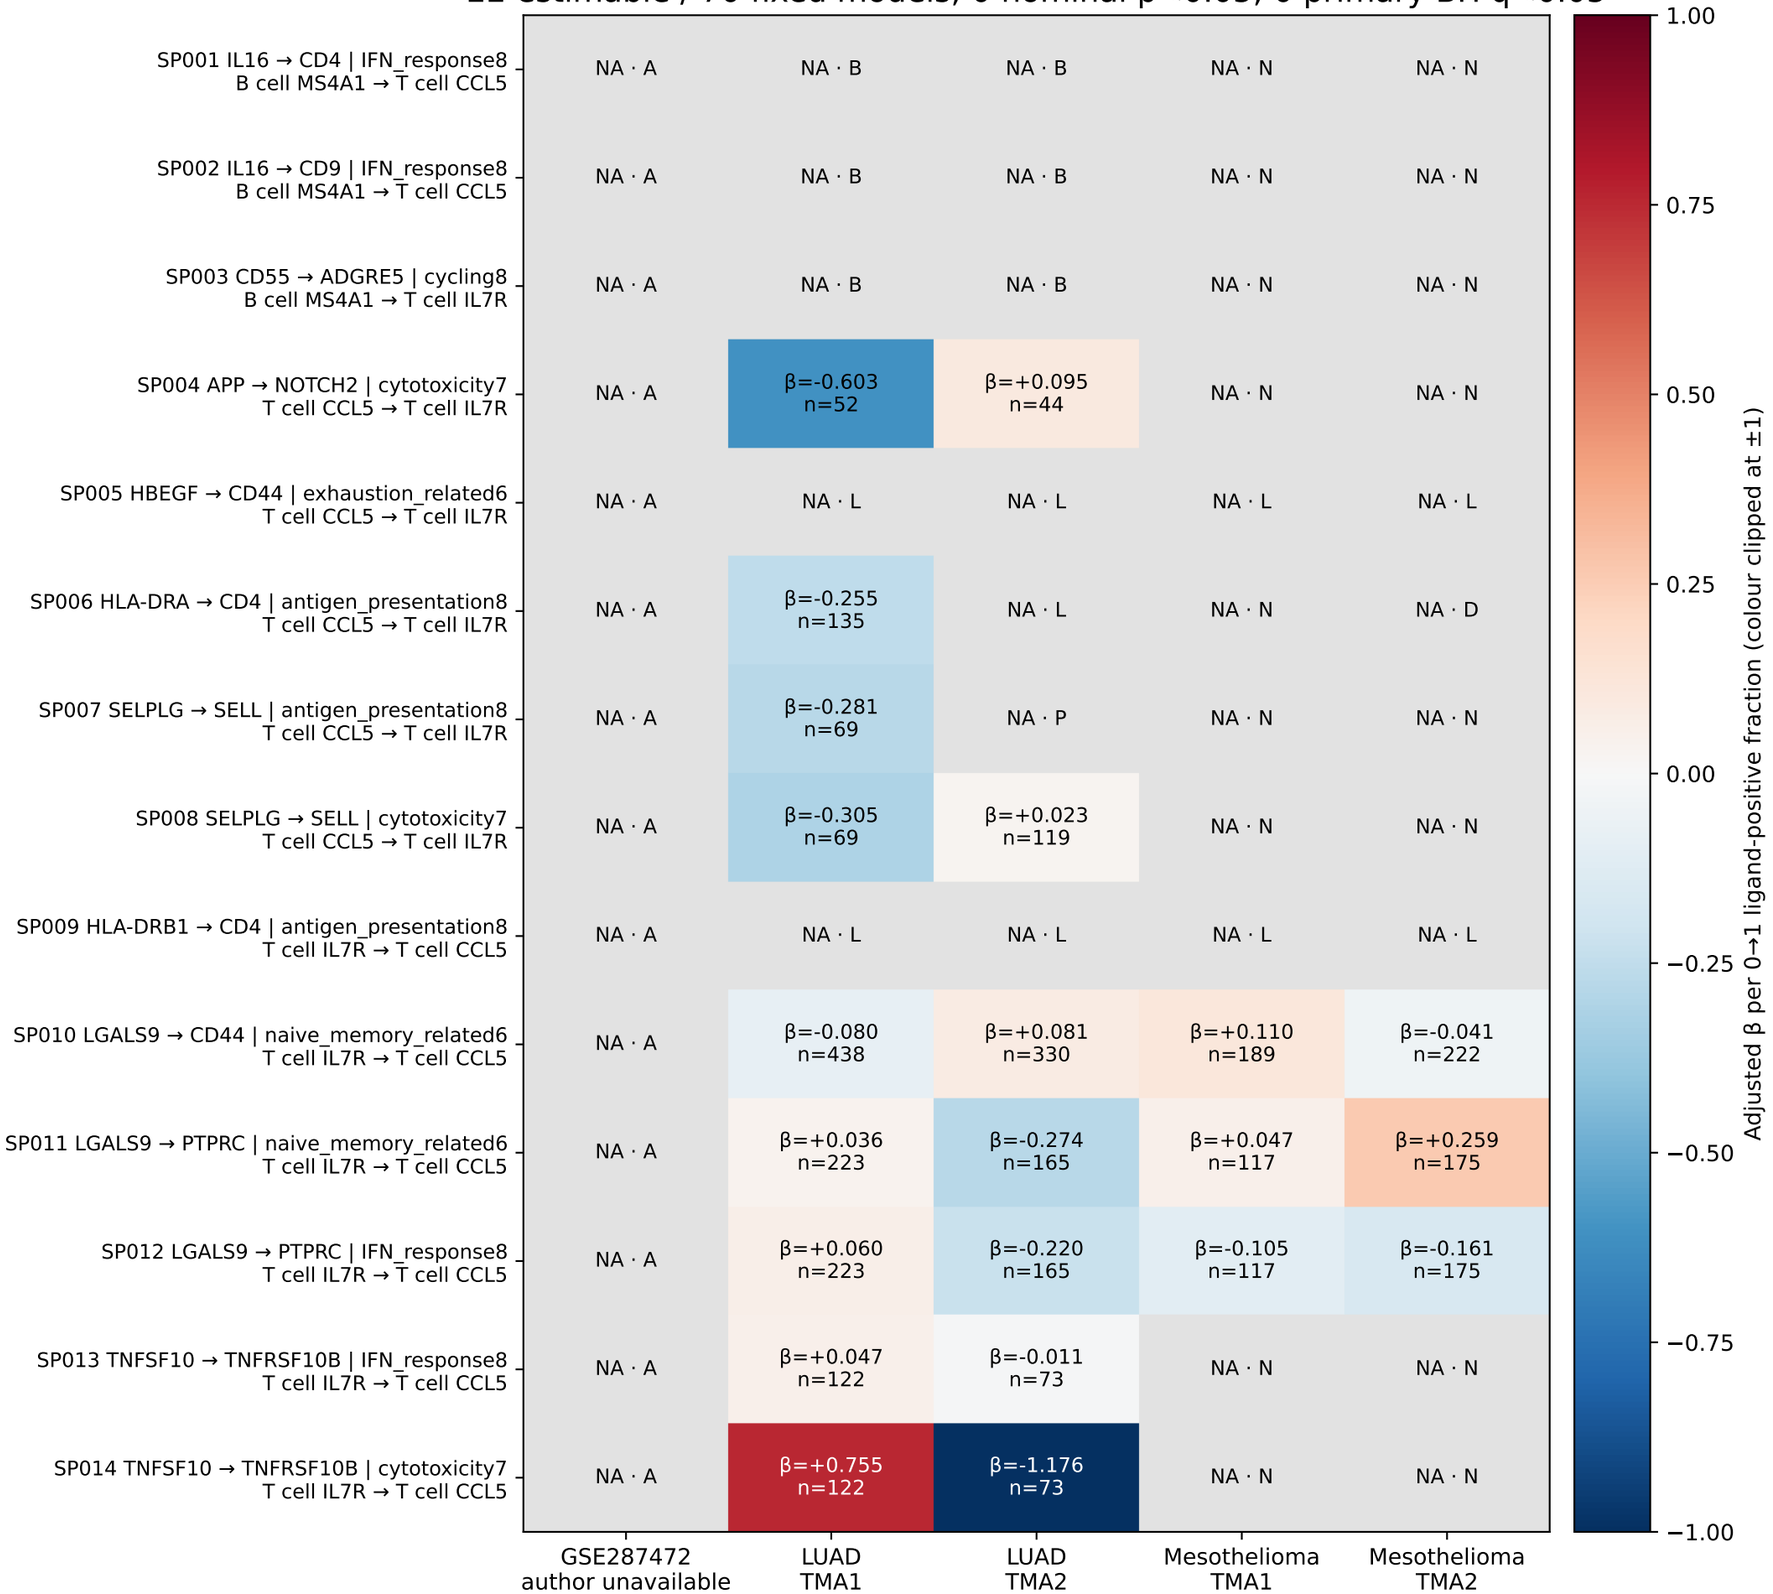
Receiver programme vs ligand-positive sender-neighbour fraction

22 estimable / 70 fixed models; 0 nominal p<0.05; 0 primary BH q<0.05



NA reasons: A author labels unavailable; B author B category unavailable; L ligand gene absent;
N <40 eligible receivers; P programme panel coverage insufficient; D residual degrees of freedom insufficient.

Within R+ identities; full native RNA, author/FOV, family membership, area/density and sender-family degree adjusted.
10,000 ligand-label permutations; full 70-test BH. FOV/TMA are not independent patients; generic programmes are not ligand-specific target evidence.
